## Chemguide - questions

## **COMPLEX IONS - NAMES**

1.	What is the difference between an anionic complex and a cationic complex?
2.	Give the names of the following complex ions.
	a) $[Co(H_2O)_6]^{2+}$
	b) $[Cu(NH_3)_4(H_2O)_2]^{2+}$
	c) [Al(OH) <sub>4</sub> ] <sup>-</sup>
	d) $[Fe(CN)_6]^4$ (Hint: this is a complex between $CN^-$ ions and iron ions. You will need to work out the charge on (and therefore the oxidation state of) the original iron ion in order to give the full name.)
	e) $[Fe(CN)_6]^{3-}$
3.	Write the formulae for the following complex ions.
	a) tetrachlorocuprate(II)
	b) hexafluoroaluminate(III)
	c) pentaaquahydroxochromium(III)
	d) diamminesilver(I)
	e) hexaaquavanadium(III) (In case you haven't come across it yet, vanadium's symbol is V.)
